City of Evanston  
Clearwell 9 Replacement Project  
Milburn Street Parking  
February 28, 2019

Project Description
The City of Evanston is beginning construction for the replacement of a 5 million gallon concrete potable water reservoir located at the corner of Lincoln Street and North Campus Drive. The project also includes a new submersible pumping system and site piping modifications. This is a significant construction project to replace a deteriorating structure that is 84 years old and a critical part of the City’s water supply system which serves the City of Evanston and its wholesale water customers. Progressive demolition and reconstruction of the reservoir will take two years.

Schedule
Traffic control along Lincoln Street is scheduled to be installed overnight on March 10th, after which time the construction crew will mobilize. Construction of the new reservoir is scheduled to be completed by February of 2021, with final site restoration completed later that spring.

Parking
This significant project will require the contractor to build temporary offices in the parking lot at the water plant. Because of the reduction of parking spaces within the water plant property, Milburn Street may be used for parking by City staff and contractors.

Signs will be posted opposite from the residential driveways for the duration of the project to ensure residents have proper clearance to back out of their driveways.
